Falls among older adults (age 65 years and older) are common. Approximately 35% to 40% of community-dwelling, generally healthy, older Americans fall annually, with rates rising steadily after age 75. In nursing homes and hospitals, these rates are even higher (1.5 falls per bed annually). Nationally and in Los Angeles County, falls are the leading cause of injury death among older adults and the most common cause of nonfatal injury hospitalization in this age group. In 2000, the total costs of treating fall-related injuries among older adults exceeded $19 billion per year; by 2020, these numbers are expected to climb to $59 billion (adjusted to 2009 dollars), largely as a consequence of the number of aging baby boomers who will turn 65+ years beginning in 2011. Collectively, falls and fall-related injuries (e.g., hip fractures) represent a growing public health problem that is frequently under-recognized and under-treated.

Although an increased risk for falling is often perceived as an inevitable part of aging, this is not so—most falls are preventable regardless of age. Effective strategies (e.g., community-based self-care programs) are available to help individuals, physicians, and community agencies prevent falls in the aging population (see Fall Prevention Resources, page 5). This article reviews the current evidence on fall detection and prevention, focusing on practical, evidence-based strategies that can be incorporated into daily practice.
In December 2009, Oakland Police and Fire Departments and an ambulance service responded to the home of a patient, who was transported to a local medical center and later confirmed to have bacterial meningitis. Exposures to this patient resulted in the hospitalization of a medical center employee and an Oakland police officer for bacterial meningitis.

Four months later, the medical center was issued $101,485 in citations by Cal/OSHA for employer violations of the state safety and health standards in connection to this exposure of bacterial meningitis. Additionally, this incident resulted in citations to the Oakland Police Department ($31,520) and Fire Department ($2,710). Citations to all three entities involved violations of the new Aerosol-Transmissible Diseases (ATD) standard (Title 8 CCR Section 5199).

This landmark standard by the California Division of Occupational Safety and Health (Cal/OSHA), which went into effect on August 5, 2009, represents the nation’s first specific regulatory response to comprehensive worker health and safety regarding respiratory diseases such as SARS, H1N1, and tuberculosis. A 1997 federal OSHA proposed standard on Occupational Exposure to Tuberculosis was withdrawn in 2003.

ATDs are epidemiologically important diseases or pathogens that are transmitted via the airborne or droplet route (Table 1). Of note, novel pathogens such as the H1N1 influenza virus that emerged in 2009 are considered reportable airborne-transmissible disease and need to be treated as such.

Who Is Affected by the Standard?
The standard applies to a variety of covered employers whose staff may have or may cause occupational ATD exposure to others, such as hospitals, nursing facilities, clinics, medical offices, home health care, public health services, medical laboratories, police services, medical transport, correctional facilities, homeless shelters, medical outreach services, drug treatment programs, mortuaries, coroners, firefighter and paramedic emergency medical responders, and maintenance or repair operations involving potentially contaminated areas or equipment.

Included in the standard are measures to prevent worker ATD exposures and procedures to follow if an exposure occurs. Many covered employers have most or many of these processes already in place. For example, the standard includes training requirements, TB screening, and the use of personal protective equipment. It also restates requirements of Cal/OSHA’s preexisting Respiratory Protection Standard (8CCR5144) to fit test respirators and to ensure confidential medical evaluation before initial fit testing. Additionally, employers must have written ATD exposure control plans, which include notification to everyone involved in a timely manner, such as the local health officer and other employers.

Employers with staff members who may be exposed to ATDs must establish a written respiratory protection program or incorporate it into their ATD Exposure Control plan. They also must maintain records of employee training and exposure incidents, and require their designated health care professional to confidentially maintain employee medical records.

New ATD Standards Take Effect
Effective September 1, 2010, health care employers must offer vaccine for measles, mumps, rubella, varicella zoster, and Tdap (tetanus, diphtheria, acellular pertussis), as well as annual influenza vaccinations to employees at no cost. If an employee elects not to be vaccinated, a written declination is required as part of the confidential employee medical record. Also effective as of this date, the employer shall provide a powered air-purifying respirator with a high-efficiency particulate air (HEPA) filter(s), or a respirator providing equivalent or greater protection to employees who perform high-hazard procedures on airborne infectious disease cases or suspected cases.

The Cal/OSHA standard can be found at www.dir.ca.gov/Title8/5199.html.

A California Department of Public Health presentation on Immunization Recommendations for Employees Covered under the standard can be found at www.cdph.ca.gov/programs/immunize/Documents/HCW%20Immunization_ATD.ppt#502.2

## It’s Time to Order Vaccine for the 2010-2011 Flu Season

For the 2010-2011 flu season, the U.S. Advisory Committee on Immunization Practices recommends universal influenza vaccination for all persons 6 months of age and older who do not have a contraindication to vaccination, such as an egg allergy.

A trivalent vaccine will protect your patients from the flu virus strains that are most likely to circulate in the fall: A/California/7/2009, A/Perth/16/2009, and B/Brisbane/60/2008. Since the pandemic H1N1 strain is included in this year’s seasonal vaccine, there will be no need for a separate pandemic H1N1 flu vaccination.

Trivalent seasonal flu vaccine will not be provided through the national centralized flu vaccine distribution program that was in place to support pandemic H1N1 flu vaccination.

Providers who usually purchase flu vaccine and have not yet placed a flu vaccine order with a manufacturer or distributor should do so immediately. Lists of manufacturers and distributors are posted at www.flusupplynews.com/resources.cfm and www.preventinfluenza.org/profs_production.asp.

Stay up to date with the latest flu vaccination information by visiting the following websites:

Upcoming Training

Healthy Aging for Women + Women & Health Care Reform
Physicians and other health care providers and leaders are invited to two free community dialogues on women’s health. Healthy Aging for Women will focus on preparing our communities for the upcoming increase in the population of aging women in LA. Women & Health Care Reform will look at prioritizing and protecting women’s health as Los Angeles begins to implement health care reform.

Hosted by the Office of Women’s Health, LA County Department of Public Health, and 30 collaborating organizations

- October 5, 2010 | 8:30 am-5 pm
- The California Endowment

For a registration form, e-mail cortal@ph.lacounty.gov.

Index of Disease Reporting Forms

All case reporting forms from the LA County Department of Public Health are available by telephone or Internet.

Animal Bite Report Form
Veterinary Public Health (877) 747-2243
www.publichealth.lacounty.gov/vet/biteintro.htm

Animal Diseases and Syndrome Report Form
Veterinary Public Health (877) 747-2243
